Scientific advances in this field have not only given us a better understanding of what is an optimal diet, but has allowed food and nutraceutical companies to market products with specific health claims, fortify existing foods, and even create new foods designed for a particular health benefit. Handbook of Nutraceuticals and Functional Foods, Second Edition, compiles the latest data from authoritative, scientific sources. It provides hard evidence on the prophylactic and medicinal properties of many natural foods. This handbook reviews more than 200 nutraceutical compounds. Each chapter includes the chemical properties, biochemical activity, dietary sources, and evidentiary findings for each compound. New topics include the use of exopolysaccharides from lactic acid bacteria, protein as a functional ingredient for weight loss, and nutraceuticals to be used in the

adjunctive treatment of depression. Two new chapters discuss recent evidence on oxidative stress and the antioxidant requirements of athletes as well as the use of nutraceuticals for inflammation. The scientific investigation of nutrition and lifestyle changes on the pain and debilitation of osteoarthritis is the subject of another new article. The book concludes with a look at future marketing opportunities paying particular attention to the alleviation of obesity. With contributions from a panel of leading international experts, *Handbook of Nutraceuticals and Functional Foods, Second Edition*, provides instant access to comprehensive, cutting edge data, making it possible for food scientists, nutritionists, and researchers to utilize this ever growing wealth of information.

The amygdala is a central component of the limbic system, which is known to play a critical role in emotional processing of learning and memory. Over these last 20 years, major advances in techniques for examining brain activity greatly helped the scientific community to determine the nature of the contribution of the amygdala to these fundamental aspects of cognition. Combined with new conceptual breakthroughs, research data obtained in animals and humans have also provided major insights into our understanding of the processes by which amygdala dysfunction contributes to various brain disorders, such as autism or Alzheimer's disease. Although the primary goal of this book is to inform experts and newcomers of some of the latest data in the field of brain structures involved in the mechanisms underlying emotional learning and memory, we hope it will also help stimulate discussion on the functional role of the amygdala and connected brain structures in these mechanisms.

"Dismounted Complex Blast Injury" (DCBI) is an explosion-induced battle injury sustained by a warfighter on foot patrol that produces a specific pattern of wounds. In particular, it involves traumatic amputation of at least one leg, a minimum of severe injury to another extremity, and pelvic, abdominal, or urogenital wounding. The US Army Surgeon General (SG) appointed a task force to study the causation, prevention, protection, treatment, and long-term care options of this BI pattern. This report will look at current candidates for "best practice" designation for prevention, mitigation, or treatment of dismounted complex blast injuries. It will address opportunities for intervention from the POI to long-term rehabilitation. The Task Force will address a systematic approach to this problem set from a medical perspective, using the Doctrine, Organization, Training, Materiel, Leadership, Personnel, Facilities and Contracting (DOTMLPF-C) approach, followed by specific recommendations for the way forward.

### **War Surgery**

This latest National Defense University military history seeks to broaden the perspective of those who are interested in understanding the effects of the wartime mobilization of American society. Through a comparative analysis of the economic, political, and social results of America's four principal wars, this study reveals the major issues faced by each wartime administration and sketches the consequences of the mobilization policies adopted. As the author, Colonel James L. Abrahamson, U.S. Army, explains, each conflict occurred in unique circumstances, required varied policies, and produced different effects on American institutions. He therefore avoids offering a simplistic list of the expected domestic consequences of any future conflict. Nevertheless, certain common factors, which may inform modern mobilization planners, surface in his analysis of these four wars. The author suggests that if planners are aware of the implications of their mobilization choices, they can better devise effective policies for drawing forth the material and human essentials of victory.

Tactical Combat Casualty Care (TCCC) has saved hundreds of lives during our nation's conflicts in Iraq and Afghanistan. Nearly 90 percent of combat fatalities occur before a casualty reaches a medical treatment facility. Therefore, the prehospital phase of care is needed to focus on reducing the number of combat deaths. However, few military physicians have had training in this area and, at the onset of hostilities, most combat medics, corpsmen, and paramedics in the U.S. military have been trained to perform battlefield trauma care through civilian-based trauma courses. These courses are not designed for the prehospital combat environment and do not reflect current practices in the area of prehospital care. TCCC was created to train Soldiers and medical personnel on current best practices for medical treatment from the point of injury to evacuation to Role 3 facilities

Paramedics are often the first port of call for those requiring emergency medical attention and, as such, they frequently encounter patients who are receiving palliative or end of life care. But as professionals whose training focuses on how to save a life, how can they best deal with patients who are approaching the end of theirs? In this situation, paramedics often need to make the difficult decision as to whether it is appropriate to transfer their patient to hospital, a decision which can have a significant impact not only on the patient and their family, but also on the paramedic themselves. This means that it is vital for paramedics to have an understanding of palliative and end of life care. This book provides a comprehensive guide to the philosophy, ethics, symptom control, emergencies and psychosocial aspects that underpin palliative and end of life care in paramedic practice. Chapters are written by paramedics and specialists in palliative and end of life care, who have decades of experience in providing care for patients in the community. Clinical chapters feature paramedic case study scenarios, aimed at allowing the reader to think about applying theory to practice. This is the first book aimed solely at supporting paramedics in their role caring for palliative and end of life patients. Contents: 1. Death & Dying in Society 2. Defining Palliative Care 3. Palliative Care Emergencies 4. Symptom Control in Palliative Care 5. Enhanced Communication 6. Care of the Dying Patient in the Last Days of Life 7. Ethics 8. Resilience in Paramedic Practice 9. Historically in warfare, the majority of all combat deaths have occurred prior to a

casualty ever receiving advanced trauma management. The execution of the Ranger mission profile in the Global War on Terrorism and our legacy tasks undoubtedly will increase the number of lethal wounds. Ranger leaders can significantly reduce the number of Rangers who die of wounds sustained in combat by simply targeting optimal medical capability in close proximity to the point of wounding. Survivability of the traumatized Ranger who sustains a wound in combat is in the hands of the first responding Ranger who puts a pressure dressing or tourniquet and controls the bleeding of his fallen comrade. Directing casualty response management and evacuation is a Ranger leader task; ensuring technical medical competence is a Ranger Medic task. A solid foundation has been built for Ranger leaders and medics to be successful in managing casualties in a combat environment. An integrated team response from non-medical personnel and medical providers must be in place to care for the wounded Ranger. The Ranger First Responder, Squad EMT, Ranger Medic Advanced Tactical Practitioner, and Ranger leaders, in essence, all Rangers must unite to provide medical care collectively, as a team, without sacrificing the flow and violence of the battle at hand. An integrated team approach to casualty response and care will directly translate to the reduction of the died of wounds rate of combat casualties and minimize the turbulence associated with these events in times of crisis. The true success of the Ranger Medical Team will be defined by its ability to complete the mission and greatly reduce preventable combat death. Rangers value honor and reputation more than their lives, and as such will attempt to lay down their own lives in defense of their comrades. The Ranger Medic will do no less. I will never leave a fallen comrade

Human factors is a scientific discipline which is used to understand the interacting elements and design of a complex system, aimed at improving system performance and optimising human well-being. This book brings together a range of specialist authors to explore some of the key concepts of human factors related to the field of paramedic practice. The system elements of paramedic practice can

include the patient, the paramedic and their colleagues, the environment, the equipment, the tasks, and the processes and procedures of the organisation. The relationships between these components are explored in detail through chapters which cover 'human error', systems thinking, human-centred design, interaction with the patient, non-technical skills of individuals and teams, well-being of the paramedic, safety culture and learning from events. This helpful and informative guide provides frontline paramedics and ambulance clinicians with practical advice and knowledge of human factors that will be helpful in supporting safe and effective practice for all involved. It will also be of interest to pre-hospital care professionals who are involved in education, learning from events, procurement and influencing safety culture. Above all, it shows how an understanding and application of human factors principles can enhance system performance and well-being, and ultimately lead to safer patient care.
