Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

Covering all species from yeast to humans, this is the first book to tell the story of selfish genetic elements that act narrowly to advance their own replication at the expense of the larger organism.

A concise guide to the care of small mammals, Ferrets, Rabbits, and Rodents: Clinical Medicine and Surgery covers the conditions seen most often in veterinary practice. The book emphasizes preventive medicine along with topics including disease management, ophthalmology, dentistry, and zoonosis. More than 400 illustrations demonstrate key concepts related to radiographic interpretation, relevant anatomy, and diagnostic, surgical, and therapeutic techniques. Now in full color, this edition adds coverage of more surgical procedures and expands coverage of zoonotic disease. From editors Katherine Quesenberry and James W. Carpenter, along with a team of expert contributors, the "Pink Book" provides an authoritative, single source of information that is hard to find elsewhere. A logical organization makes it quick and easy to find important information, with each section devoted to a single animal and chapters within each section organized by body system. Over 400 photographs and illustrations highlight key concepts such as radiographic interpretation and the main points of diagnostic, surgical, and therapeutic techniques. A chapter on ophthalmology provides hard-to-find

information on eye care for ferrets, rabbits, rodents, and other small mammals. Coverage of preventive medicine includes basic biology, husbandry, and routine care of the healthy animal. The drug formulary supplies dosage instructions for ferrets, rabbits, guinea pigs, chinchillas, hamsters, rats/mice, prairie dogs, hedgehogs, and sugar gliders. Chapter outlines offer at-a-glance overviews of the contents of each chapter. Handy tables and charts make it easy to find key information. Expanded Zoonotic Diseases chapter adds more depth along with the latest information on the rising potential for disease transmission to humans as exotic pets become more popular. Additional surgical procedures for each species are included, some with step-by-step instructions accompanied by color photographs and line drawings. Full-color images show the sometimes minute structures of these small animals and make accurate diagnoses easier, especially for lymphoproliferative diseases of rabbits, endoscopy, cytology, and hematology.

The book contains of five chapters. The purpose of chapter 1 is to investigate under which conditions it can be expected that the negotiation partners substitute a competitive definition of the situation for a cooperative one. A general model for negotiation situations has been developed. Several research propositions focusing on the transformation from a win- loose context, to a win-win context are presented. The conditions which the purpose of the chapter focus on, are summarized in a visualized model for negotiation situations. The question to be discussed in chapter 2 is the following: Why are we more inclined to believe in one type of information than another? Recent literature is discussed through a general model of the cognitive authority of information. Inputs into the model are: cognitive processes, cognitive principles, heuristic mechanisms, information processes and characteristics of the speaker (the sender). Outcomes are defined as the cognitive

authority of information. Several research propositions based on the model are presented. Chapter 3 Prospect Theory in Negotiations discusses the problem in organizational change projects, that people often resist organizational change. Many change projects in organizations does not reach their goals. The question is why? This chapter investigates how prospect theory can be used to explain people's resistance to organizational change. If we know why people resist organizational change, we as leaders can do something to promote the change project. The objective of this chapter is to advise managers and leaders on ways of reducing resistance to organizational change. We identify seven propositions that explain how managerial strategies reduce organizational change. We recommend seven measures that may be employed by management to obtain support for the negotiated situation. Chapter 4 mastering, discusses the negotiation problem that managers have little insight into issues relating to employees' sense of mastery. The question discussed is how managers can establish workplace conditions conducive to facilitating a sense of mastery for employees, because this will facilitate the negotiation context in the organization. The purpose of the chapter is helping managers gain greater insight into issues relating to employees' sense of mastery in order to contribute to a improved negotiation situation. At the end of the chapter an analytical model consisting of seven elements is visualized, which can be applied as a management tool for negotiation situations. In chapter 5 Attitude change in Negotiations, we discusses the problem related to the difficulty of changing attitudes. The question asked is: How can managers change the attitudes of employees? The purpose is to develop a toolkit that managers can use to change employees' attitudes in negotiation situations. A system of 13 measures that managers can use to change the attitudes of employees is visualized as a toolkit for managers in negotiation situations.

CHRISTIANITY AND ISLAM

The idea for this book predates not only my trilogy on colonial rebellion but my decision to produce the Reconsidering Chartism series. Its gestation began in 2003 with an off-hand comment by a student during a session on European influences on Chartism in the 1840s. She asked: 'what impact did Chartism have on the rest of the world?' I have spent the years since trying to find an answer and this has taken me in directions I could not have anticipated when it all began. Although much has been written about Chartism in Britain, though considerably less on Ireland, when I started work on this problem I quickly found that, apart from articles considering European influences on Chartism and on Chartism in Australia and a book on Chartists in the United States, this was not a question that had been the subject of serious consideration. The opening chapters address this issue. The first examines the internationalism of Chartism something that was evident from the beginnings of the movement. Chapter 2 looks at the relationship between Chartism and events in Canada during the 1830s that led to the rebellions in the Canadas in 1837 and 1838 and the ways in which Scottish Chartism, in particular, had an impact on the politics of the Clear Grits of the early 1850s. This is followed by a chapter that explores Chartism and the Australian colonies especially NSW and Victoria during the 1840s and 1850s when, what were previously penal colonies, made the transition from rule by governors to democratic constitutions in which the People's Charter played an influential

part. Chapter 4 draws this discussion together by asking just how far Chartism was a 'global force' in the mid-nineteenth century. The remainder of the book brings together issues that have been a frequent feature throughout the series. The ways in which historians have regarded Chartism have, since Gammage first wrote about it, been matters of disagreement and is considered in Chapters 5 and 6. There was persistent tension in working-class political movements in the first half of the nineteenth century over the relationship between familial and political concerns as ideas of masculinity and femininity shifted. The precise extent of women's participation in movements of protest is difficult to quantify and there is little sign of any formal involvement in politics before radical political reform revived, in London and provincial cities and in the northern textile districts after 1815. Women were not only part of the crowd but from the Queen Caroline affair in 1820 through to the 1850s had a particular role in radical politics, the subject of Chapter 7. Many of those who have commented on Chartism have pointed to leadership, or rather lack of it, as one of the reasons why it ultimately failed. Chapter 8 considers the nature of Chartist leadership and suggests that the traditional view of its ineffectiveness reflects an O'Connor focussed view and fails to consider the importance of local leadership or recognise the different sorts of 'leader' within the movement. Chapter 9 is an extensive revision of a paper on Chartism and the State originally composed in 2003. Chartists had little political muscle and, despite their mass support, were powerless when faced by the coercive power of the local and national states. The final chapter looks at how Chartism has been remembered and memorialised. For radicals, monuments were often less about consensus and more about building permanent symbols of defiance and opposition.

The Origin of Species by Means of Natural Selection

When this classic work was first published in 1975, it created a new discipline and started a tumultuous round in the age-old nature versus nurture debate. The controversy surrounding the book's publication--and surrounding its central claim that human social behavior has a biological foundation--reverberates to this day. In the introduction to this twenty-fifth anniversary edition, Edward O. Wilson shows how research in human genetics and neuroscience over the past quarter of a century has strengthened the case for a biological understanding of human nature.

Clarissa's Book of Short Stories

Provides quick access to reviews of books, periodicals, books on tape and electronic media representing a wide range of popular, academic, and professional interests. More than 60 publications are indexed, including journals and national general interest publications and newspapers.

Mechanisms of DNA Recombination and Genome Rearrangements: Intersection between Homologous Recombination, DNA Replication and DNA Repair, Volume 601, the latest release in the Methods in Enzymology series, continues the legacy of this premier serial with quality chapters authored by leaders in the field. Homologous genetic recombination remains the most enigmatic process in DNA metabolism. The molecular machines of recombination preserve the integrity of the genetic material in all organisms and generate genetic diversity in evolution. The same molecular machines that support genetic integrity by orchestrating accurate repair of the most deleterious DNA lesions, however, also promote survival of cancerous cells and emergence of radiation and chemotherapy resistance. This two-volume set offers a comprehensive set of cutting edge methods to study various aspects of homologous recombination and cellular processes that utilize the enzymatic machinery of recombination. The chapters are written by the leading researches and cover a broad range of topics from the basic molecular mechanisms of recombinational proteins and enzymes to emerging cellular techniques and drug discovery efforts. contributions by the leading experts in the field of DNA repair, recombination, replication and genome stability documents cutting edge methods

Life

In the wake of endless terrorist attacks that have taken the U.S. to the brink of societal collapse, a kind of rabid zombie is born that catapults the world beyond the brink and into unprecedented levels of terror. And on the eve of the apocalypse, only three types may survive: the wealthy, the fortunate, and the well prepared. A long string of terrorist attacks has humanity on edge, which prompts John, a very rich man, and his family to buy a mountain in the Rockies and build a massive bomb shelter there. It's their own version of NORAD-and their salvation. Unwilling to leave any family members behind, John also builds a house with a bomb shelter for his niece, Maggie, who is going to college in Boulder. Meanwhile, an ex-military biologist, Simon, and his son, Peter, have been living above a bomb shelter in a Denver suburb for years, and they are more than prepared, or so they think. After the attacks subside for a few years, protests against the government roar up across the country. Rampant and uncontained, the situation forces the police to use an experimental tear gas. However, the tear gas has been tampered with, which causes a kind of human rabies, creating a kind of zombie effect in anyone infected. Suddenly, "uncontrollable" means something all together different. Not even John, Maggie, Simon, and Peter, despite their preparations, can anticipate what is to come. When the infected spread outside the major protest cities, it cripples the country and makes it vulnerable to further attack. An eventual nuclear attack will force the president to respond by attacking the suspected countries, thus creating a domino effect that will become full-out nuclear war, World War 3, and, eventually, the Apocalypse.

Near Fordyce, New Mexico in the midst of the Sonoma Desert lies the Sonoma Quadrant. No airplanes have ever disappeared in the Quadrant. Obviously, no ships have ever disappeared there either. What has disappeared there? PeopleFor hundreds of years people have gone into the Sonoma and have never returned. Public records in nearby Fordyce indicate seventy-two such disappearances dating back as far as 1874 when records were first kept. Records from the abandoned Mexican village of Sonoma Rojo indicate disappearances dating back to 1644. Indian legends dating back to the Anasasi hint at the mysterious area as a place one does not return from. But one man did emerge. In 1880, a prospector known only as Griswald was allowed to leave. Now, in 2003, Griswald is returning to the Quadrant and taking with him Tom and John Fischer. How could he still be alive? Why, after one hundred and twenty-three years would Griswald return? In this sequel to C.H. Stem Cell Biology and Tissue Engineering in Dental Sciences bridges the gap left by many tissue engineering and stem cell biology titles to highlight the significance of translational research in this field in the medical sciences. It compiles basic

developmental biology with keen focus on cell and matrix biology, stem cells with relevance to tissue engineering biomaterials including nanotechnology and current applications in various disciplines of dental sciences; viz., periodontology, endodontics, oral & craniofacial surgery, dental implantology, orthodontics & dentofacial orthopedics, organ engineering and transplant medicine. In addition, it covers research ethics, laws and industrial pitfalls that are of particular importance for the future production of tissue constructs. Tissue Engineering is an interdisciplinary field of biomedical research, which combines life, engineering and materials sciences, to progress the maintenance, repair and replacement of diseased and damaged tissues. This ever-emerging area of research applies an understanding of normal tissue physiology to develop novel biomaterial, acellular and cell-based technologies for clinical and non-clinical applications. As evident in numerous medical disciplines, tissue engineering strategies are now being increasingly developed and evaluated as potential routine therapies for oral and craniofacial tissue repair and regeneration. Diligently covers all the aspects related to stem cell biology and tissue engineering in dental sciences: basic science, research, clinical application and commercialization Provides detailed descriptions of new, modern technologies, fabrication techniques employed in the fields of stem cells, biomaterials and tissue engineering research including details of latest advances in nanotechnology Includes a description of stem cell biology with details focused on oral and craniofacial stem cells and their potential research application throughout medicine Print book is available and black and white, and the ebook is in full color

Genes in Conflict

“We are the primary drivers of change. We will directly and indirectly determine what lives, what dies, where, and when. We are in a different phase of evolution; the future of life is now in our hands.” Why are rates of conditions like autism, asthma, obesity, and allergies exploding at an unprecedented pace? Why are humans living longer, getting smarter, and having far fewer kids? How might your lifestyle affect your unborn children and grandchildren? How will gene-editing technologies like CRISPR steer the course of human evolution? If Darwin were alive today, how would he explain this new world? Could our progeny eventually become a different species—or several? In *Evolving Ourselves*, futurist Juan Enriquez and scientist Steve Gullans conduct a sweeping tour of how humans are changing the course of evolution—sometimes intentionally, sometimes not. For example:

- Globally, rates of obesity in humans nearly doubled between 1980 and 2014. What’s more, there’s evidence that other species, from pasture-fed horses to lab animals to house cats, are also getting fatter.
- As reported by U.S. government agencies, the rate of autism rose by 131 percent from 2001 to 2010, an increase that cannot be attributed simply to increases in diagnosis rates.
- Three hundred years ago, almost no one with a serious nut allergy lived long enough to reproduce. Today, despite an environment in which food allergies have increased by 50 percent in just over a decade, 17 million Americans who suffer from food allergies survive, thrive, and pass their genes and behaviors on to the next generation.
- In the pre-Twinkie era, early humans had quite healthy mouths. As we began cooking, bathing, and using antibiotics, the bacteria in our bodies changed dramatically and became far less diverse. Today

the consequences are evident not only in our teeth but throughout our bodies and minds. Though these harbingers of change are deeply unsettling, the authors argue that we are also in an epoch of tremendous opportunity. New advances in biotechnology help us mitigate the cruel forces of natural selection, from saving prematurely born babies to gene therapies for sickle cell anemia and other conditions. As technology like CRISPR enables us to take control of our genes, we will be able to alter our own species and many others—a good thing, given that our eventual survival will require space travel and colonization, enabled by a fundamental redesign of our bodies. Future humans could become great caretakers of the planet, as well as a more diverse, more resilient, gentler, and more intelligent species—but only if we make the right choices now. Intelligent, provocative, and optimistic, *Evolving Ourselves* is the ultimate guide to the next phase of life on Earth. From the Hardcover edition.
