The uneasy balance between these worlds is shattered when Starr witnesses the fatal shooting of her childhood best friend Khalil at the hands of a police officer. Khalil was unarmed. Soon afterward, his death is a national headline. Some are calling him a thug, maybe even a drug dealer and a gangbanger. Protesters are taking to the streets in Khalil's name. Some cops and the local drug lord try to intimidate Starr and her family. What everyone wants to know is: what really went down that night? And the only person alive who can answer that is Starr. But what Starr does—or does not—say could upend her community. It could also endanger her life. And don't miss *On the Come Up*, Angie Thomas's powerful follow-up to *The Hate U Give*.

Engage students in mathematics using growth mindset techniques The most challenging parts of teaching mathematics are engaging students and helping them understand the connections between mathematics concepts. In this volume, you'll find a collection of low floor, high ceiling tasks that will help you do just that, by looking at the big ideas at the third-grade level through visualization, play, and investigation. During their work with tens of thousands of teachers, authors Jo Boaler, Jen Munson, and Cathy Williams heard the same message—that they want to incorporate more brain science into their math instruction, but they need guidance in the techniques that work best to get across the concepts they needed to teach. So the authors designed Mindset Mathematics around the principle of active student engagement, with tasks that reflect the latest brain science on learning. Open, creative, and visual math tasks have been shown to improve student test scores, and more importantly change their relationship with mathematics and start believing in their own potential. The tasks in Mindset Mathematics reflect the lessons from brain science that: There is no such thing as a math person - anyone can learn mathematics to high levels. Mistakes, struggle and challenge are the most important times for brain growth. Speed is unimportant in mathematics. Mathematics is a visual and beautiful subject, and our brains want to think visually about mathematics. With engaging questions, open-ended tasks, and four-color visuals that will help kids get excited about mathematics, Mindset Mathematics is organized around nine big ideas which emphasize the connections within the Common Core State Standards (CCSS) and can be used with any current curriculum.

In life, we all experience the good, the bad and sometimes, the ugly. It is easy to remain focused and confident during the good days but what about those times when there is uncertainty and it feels like life has kicked you in the gut and you are in need of a breakthrough? In life we experience things that aren't in our control, leaving us to wonder. Why me? Often times, it is during the dark days that we really discover our strength, purpose and worth. Sabrina, knows all too well just how unpredictable life can be. She is a small town girl who experienced the good, bad and ugly. Jeremiah 29:11 became her constant reminder that there was a greater plan and that it would all work out for her good. Just when she thought she couldn't cry another tear, walk another step or take another breath, hope was restored and life began to bloom again.

Textbooks are symbols of centuries-old education. They're often outdated as soon as they hit students' desks. Acting "by the textbook" implies compliance and a lack of creativity. It's time to ditch those textbooks--and those textbook assumptions about learning. In *Ditch That Textbook*, teacher and blogger Matt Miller encourages educators to throw out meaningless, pedestrian teaching and learning practices. He empowers them to evolve and improve on old, standard, teaching methods. *Ditch That Textbook* is a support system, toolbox, and manifesto to help educators free their teaching and revolutionize their classrooms.

Banish math anxiety and give students of all ages a clear roadmap to success Mathematical Mindsets provides practical strategies and activities to help teachers and parents show all children, even those who are convinced that they are bad at math, that they can enjoy and succeed in math. Jo Boaler—Stanford researcher, professor of math education, and expert on math learning—has studied why students don't like math and often fail in math classes. She's followed thousands of students through middle and high schools to study how they learn and to find the most effective ways to unleash the math potential in all students. There is a clear gap between what research has shown to work in teaching math and what happens in schools and at home. This book bridges that gap by turning research findings into practical activities and advice. Boaler translates Carol Dweck's concept of 'mindset' into math teaching and parenting strategies, showing how students can go from self-doubt to strong self-confidence, which is so important to math learning. Boaler reveals the steps that must be taken by schools and parents to improve math education for all. Mathematical Mindsets: Explains how the brain processes mathematics learning Reveals how to turn mistakes and struggles into valuable learning experiences Provides examples of rich mathematical activities to replace rote learning Explains ways to give students a positive math mindset Gives examples of how assessment and grading policies need to change to support real understanding Scores of students hate and fear math, so they end up leaving school without an understanding of basic mathematical concepts. Their evasion and departure hinders math-related pathways and STEM career opportunities. Research has shown very clear methods to change this phenomena, but the information has been confined to research journals—until now. Mathematical Mindsets provides a

proven, practical roadmap to mathematics success for any student at any age.

What is the secret of talent? How do we unlock it? This groundbreaking work provides readers with tools they can use to maximize potential in themselves and others. Whether you're coaching soccer or teaching a child to play the piano, writing a novel or trying to improve your golf swing, this revolutionary book shows you how to grow talent by tapping into a newly discovered brain mechanism. Drawing on cutting-edge neurology and firsthand research gathered on journeys to nine of the world's talent hotbeds—from the baseball fields of the Caribbean to a classical-music academy in upstate New York—Coyle identifies the three key elements that will allow you to develop your gifts and optimize your performance in sports, art, music, math, or just about anything.

- **Deep Practice** Everyone knows that practice is a key to success. What everyone doesn't know is that specific kinds of practice can increase skill up to ten times faster than conventional practice.
- **Ignition** We all need a little motivation to get started. But what separates truly high achievers from the rest of the pack? A higher level of commitment—call it passion—born out of our deepest unconscious desires and triggered by certain primal cues. Understanding how these signals work can help you ignite passion and catalyze skill development.
- **Master Coaching** What are the secrets of the world's most effective teachers, trainers, and coaches? Discover the four virtues that enable these "talent whisperers" to fuel passion, inspire deep practice, and bring out the best in their students. These three elements work together within your brain to form myelin, a microscopic neural substance that adds vast amounts of speed and accuracy to your movements and thoughts. Scientists have discovered that myelin might just be the holy grail: the foundation of all forms of greatness, from Michelangelo's to Michael Jordan's. The good news about myelin is that it isn't fixed at birth; to the contrary, it grows, and like anything that grows, it can be cultivated and nourished. Combining revelatory analysis with illuminating examples of regular people who have achieved greatness, this book will not only change the way you think about talent, but equip you to reach your own highest potential.

FIVE STAR REVIEW by READERS' FAVORITE A story about first loves, lasting friendships, and remembering that family will always be there, whether you realize it or not. CHARLOTTE Hubbard dreams about falling in love on a daily basis, but she's long rejected the idea that someone would ever be interested in an overweight, unappealing girl like her; an opinion that is shared by her way more popular and attractive sister who seems to enjoy pointing out Charlotte's flaws as much as possible. AND . . . Then there's MILES Fiester, who thinks that making the basketball team is as impossible as getting the girl he's liked since grade school to notice him. He'd have more luck getting his deadbeat dad to visit him for a day. But, in the first few weeks of high school, Charlotte and Miles come to discover that life is unpredictable, love happens when you least expect it, and there's always a first for everything."

Teachers need to be able to diagnose what their students do and don't understand about mathematics. Examining Mathematics Practice through Classroom Artifacts helps teachers become more analytic about their students' thinking by showing them how to use student artifacts to evaluate what is happening in the classroom. Study after study shows that as students grow, they become increasingly focused on technology-driven communication. Cyber-dialogue replaces face-to-face interactions in all aspects of their lives. And yet, has there ever been a greater need for students to learn the art of "talk," to be able to converse "live" with others, to collaborate, negotiate, and learn from one another? To use talk to think, and to build new ideas? Maria Nichols guides us beyond teaching students to talk politely about books to teaching them to have meaningful conversations-purposeful talk that serves as a tool for constructing understanding with others. She provides a flexible process that gives teachers a solid foundation in facilitating discussions, allowing them to meet the challenges of unpredictable, exploratory talk in the elementary classroom. She shows teachers: strategies to address different talk personalities and the dynamic nature of talk specific teaching moves to use when facilitating talk how to use a cycle of focus, facilitation, and feedback to deepen students' ability with talk important "look-fors" to assess children's talk with an inquiry mindset. The voices of children engaged in meaningful classroom conversations are scattered throughout the book, allowing teachers to see how Maria's strategies work. "What I hope emerges from children's talk," Maria writes, "is their brilliance, the depth of thinking and understanding that becomes possible when they engage in purposeful talk, and the sheer joy of dialogic classrooms."

This is the eBook of the printed book and may not include any media, website access codes, or print supplements that may come packaged with the bound book. Integrating Math and Science in Early Childhood Classrooms Through Big Ideas offers teachers a way to think about the future classroom and to meet the needs of children who come to into it with diverse experience, knowledge, and abilities. “Change how we think about math and science for young children,” the authors say in their Preface. “Instead of separating the disciplines, planning lessons and topics and projects aimed at math OR science content, let’s look at the world the way the child does. Children think in terms of big ideas.” In this unique book, the authors focus on big ideas—like patterns, transformation, movement, balance, and relationships—as a way to think about content, and they integrate science and mathematics through these big ideas, rather than linking them topically. The book looks at why it is important to think about thinking, introduces assessment early to help the teacher plan for assessment before teaching even begins, and sets up an environment that will support the construction of the big ideas that integrate math and science. Real-life scenarios provide invaluable insights into the teacher’s thinking and planning, and each chapter includes two modules to be used for in-depth exploration of different aspects of the big ideas. It’s a unique exploration of thinking and learning.
