New Media and Popular Imagination offers a highly original account of the ways in which successive media of electronic communication - radio, television, and digital media - have been anticipated, debated, and taken up in the twentieth-century United States. Intended as an intervention in the emerging scholarly and policy debates around contemporary digital culture, the book analyses popular responses to earlier moments of technological innovation in the twentieth-century.

Successive electronic media have challenged the borders between private and public, disturbed notions of national identity, and disrupted the gendered routines and spaces of the private home. Illuminating both the continuities and disjunctions between old media and new, New Media and Popular Imagination offers new insights into the relationship between technological change and cultural form.

Antistatic sprays from several different manufacturers are examined. The sprays are examined for contamination potential (i.e., outgassing and nonvolatile residue), corrosiveness on an aluminum mirror surface, and electrostatic effectiveness. In addition, the chemical composition of the antistatic sprays is determined by infrared spectrophotometry, mass spectrometry, and ultraviolet spectrophotometry. The results show that 12 of the 17 antistatic sprays examined have a low contamination potential. Of these sprays, 7 are also noncorrosive to an aluminum surface. And of these, only 2 demonstrate good electrostatic properties with respect to reducing voltage accumulation; these sprays did not show a fast voltage dissipation rate however. The results indicate that antistatic sprays can be used on a limited basis where contamination potential, corrosiveness, and electrostatic effectiveness is not critical. Each application is different and proper evaluation of the situation is necessary. Information on some of the properties of some antistatic sprays is presented in this document to aid in the evaluation process. Ming, James E. Goddard Space Flight Center
