## Introduction to organic and biological chemistry

Bioenergetics of Photosynthesis covers the transformation of energy in biological systems, with an emphasis on photosynthesis. The biochemical and biophysical aspects are given much focus in this book. The historical development of the concepts used in this book is reviewed. This reference also analyzes experimental data and their results. This publication contains 12 chapters. The first chapter introduces the concept of photosynthesis. Then, the next chapter explores the relationship between chloroplast structure and function. Other concepts covered in this book include the primary events (energy transfer and light absorption), delayed light emission, and chlorophyll fluorescence. The mechanism of excitation energy, oxygen evolution, and chlorophyll fluorescence are also explained. Furthermore, this book discusses the electron transport pathway, primary acts of energy conservation in chloroplast membranes, and molecular organization of chlorophyll. Finally, it describes the relationship of the structure of chloroplast membrane to energy coupling and ion transport. This book will be a good resource for students and researchers alike, especially in the fields of cell biology, plant physiology, biochemistry, and biophysics.

### **Current Topics in Bioenergetics**

This novel, interdisciplinary text presents biological understanding in terms of general underlying principles, treating energy as the overarching theme and emphasizing the all-pervading influence of energy transformation in every process, both living and non-living. Key processes and concepts are explained in turn, culminating in a description of the overall functioning and regulation of a living cell. The book rounds off the story of life with a brief account of the endosymbiotic origins of eukaryotic cells, the development of multicellularity, and the emergence of modern plants and animals. Multidisciplinary research in science is becoming commonplace. However, as traditional boundaries start to break down, researchers are increasingly aware of the deficiencies in their knowledge of related disciplines. *Introducing Biological Energetics* redresses the reciprocal imbalance in the knowledge levels of physical and biological scientists in particular. Its style of presentation and depth of treatment has been carefully designed to unite these two readerships.

Current Topics in Bioenergetics, Volume 2 provides information pertinent to biological energy transduction, both at the molecular level and in systems having a higher degree of organization. This book presents the contractile mechanisms in cilia and flagella. Organized into 10 chapters, this volume begins with an overview of the concept of the photosynthetic unit that has been deeply involved in all models of photosynthesis. This text then discusses the mechanisms of light-induced conformational changes in chloroplasts, mediated by ion transport. Other chapters consider the conservation and utilization of energy derived from the oxidation of organic substrates by plant mitochondria. This book discusses as well the role of ubiquinone, which has undergone the familiar difficulty in establishing whether a redox active component is an obligatory member of the electron transfer in the respiratory chain. The final chapter deals with the steady state potentials found in the inner ear of mammals. This book is a valuable resource for otolaryngologists and scientists.

### **Biological Thermodynamics**

Introduction to Biomolecular Energetics Including Ligand-Receptor Interactions focuses on the concepts of energetics and their biological applications, including the study of ligand-receptor interactions. The book provides quantitative calculations and addresses topics that have become more prominent in the biochemical and related sciences in recent years, including the first and second laws of thermodynamics, the concept of entropy, free energy or chemical potential, group-transfer potential, physicochemical behavior, and enzyme kinetics. This volume is organized into 10 chapters, and it begins with an overview of the scope of energetics and two general approaches to the field: the classical or phenomenological approach and the statistical-molecular approach. The chapters that follow explore the concepts of energy and entropy in the context of the first and second laws of thermodynamics, along with the relationships between work, heat, energy and entropy as an index of exhaustion. The discussion then shifts to the free energy function and general procedures for computing standard free energies. The book also introduces the reader to the fundamental relationship between chemical potential (free energy) and concentration; high-energy bond and the concept of group-transfer potential; the use of thermodynamic methods in the analysis of physicochemical behavior; and statistical thermodynamics. The final chapter examines the number of ligands that are bound by the receptor entity, how strongly the ligands are held, and the molecular nature of the forces of ligand-receptor interaction. This book will be of interest to biologists and those who want

to understand the principles of energetics governing biochemical changes.

increasingly complex levels of metabolism from cells to ecosystems. Utilizing scientific explanations, analyses of ecosystem functions, extensive references, and cutting-edge examples of energy flow in ecosystems, it is an essential resource to aid in understanding the scientific basis of the role played by ecological systems in climate change. This book addresses the need to understand the global carbon cycle and the interrelationships among the disciplines of biology, chemistry, and physics in a holistic perspective. The Global Carbon Cycle and Climate Change is a compendium of easily accessible, technical information that provides a clear understanding of energy flow, ecosystem dynamics, the biosphere, and climate change. "Dr. Reichle brings over four decades of research on the structure and function of forest ecosystems to bear on the existential issue of our time, climate change. Using a comprehensive review of carbon biogeochemistry as scaled from the physiology of organisms to landscape processes, his analysis provides an integrated discussion of how diverse processes at varying time and spatial scales function. The work speaks to several audiences. Too often students study their courses in a vacuum without necessarily understanding the relationships that transcend from the cellular process, to organism, to biosphere levels and exist in a dynamic atmosphere with its own processes, and spatial dimensions. This book provides the template whereupon students can be guided to see how the pieces fit together. The book is self-contained but lends itself to be amplified upon by a student or professor. The same intellectual quest would also apply for the lay reader who seeks a broad understanding." --W.F.
