Predictive value of indicators for identifying child

After decades of decline, the maternal mortality rate in the United States has increased over the last 10 years. According to the Centers for Disease Control and Prevention (CDC), between 800 and 900 women in the United States die each year from pregnancy-related complications, illnesses or events. In 2018, the U.S. maternal mortality rate (MMR)—the rate the CDC defines as the number of

One study, which examined data from more than 309,000 people, found that lack of strong relationships increased the risk of premature death from all causes by 50% — an effect on mortality risk roughly comparable to smoking up to 15 cigarettes a day, and greater than obesity and physical inactivity.

RhymeZone: great rhymes

The Black Death (also known as the Pestilence, the Great Mortality, or the Plague) was a bubonic plague pandemic occurring in Afro-Eurasia from 1346-53. It is the most fatal pandemic recorded in human history, resulting in the deaths of up to 75-200 million people in Eurasia and North Africa, peaking in Europe from 1347 to 1351. Bubonic plague is caused by the bacterium *Yersinia pestis*, but

Infant mortality is the death of young children under the age of 1. This death toll is measured by the infant mortality rate (IMR), which is the probability of deaths of children under one year of age per 1000 live births. The under-five mortality rate, which is referred to as the child mortality rate, is also an important statistic, considering the infant mortality rate focuses only on
